

VOLTPAY

VLT WHITEPAPER

VERSION 3.0 - PRESALE EDITION
BNB Smart Chain | September 2026

UTILITY | PAYMENTS | WALLET | AI

Official Mainnet Contract
0xE90714e6e4becEc65F33D3099F95B42B6e3168aE
Verified Exact Match on BscScan

THIS VERSION SUPERSEDES PREVIOUS VOLTPAY ALLOCATION AND PRESALE SECTIONS

Executive Summary

VoltPay is a non-custodial Web3 payment ecosystem being built on BNB Smart Chain. The project combines the VoltPay Wallet, the VoltAI assistance layer and the VLT utility token into one infrastructure focused on accessible digital payments, user-controlled custody and practical token utility.

The VLT smart contract is deployed on BNB Smart Chain Mainnet and its source is verified on BscScan as an Exact Match. Total supply is permanently fixed at 200,000,000 VLT. Public trading remains disabled during launch preparation.

Mainnet status: Contract deployment and source verification are complete. The current pre-launch stage focuses on third-party audit, launchpad verification, presale preparation, liquidity and public transparency.

Core Parameters

Parameter	Current Mainnet Setting
Network	BNB Smart Chain (BSC Mainnet) - Chain ID 56
Token	VoltPay (VLT)
Standard	BEP-20 (ERC-20 interface compatible)
Total Supply	200,000,000 VLT - fixed
Decimals	18
Minting	None
Buy Fee	2%
Sell Fee	4%
Processed Fee Split	50% liquidity / 50% treasury
Mainnet Contract	0xE90714e6e4becEc65F33D3099F95B42B6e3168aE
PancakeSwap V2 Pair	0x6cFF8650a2e8Affd64a48eaf227A0C74cE767892
Trading Status	Disabled during launch preparation

1. Introduction

VoltPay is designed to simplify blockchain-based payments without taking custody of user assets. The ecosystem is structured around self-custody, accessible interfaces and practical VLT utility. VLT is intended to connect wallet activity, payments, liquidity and ecosystem services rather than operate only as a standalone market asset.

2. The Problem

Web3 adoption remains constrained by fragmented tools, wallet complexity and onboarding that often assumes technical knowledge.

- Complex wallet and network workflows
- Fragmented fiat-to-crypto access
- Limited guidance for non-technical users
- Weak connection between many tokens and practical product utility
- Dependence on centralized custody in many payment experiences

3. The VoltPay Solution

- VoltPay Wallet - a user-controlled digital-asset interface
- VoltAI - multilingual product assistance and onboarding
- VLT - a utility token intended for ecosystem activity and payments
- Fiat on-ramp integrations - planned through approved third-party providers
- Merchant and marketplace integrations - planned for real-world utility
- Gas-sponsored VLT transfers - planned for eligible transfers inside official VoltPay clients

4. Design Principles

- Non-custodial by design: VoltPay does not require custody of user private keys for wallet operation.
- Verifiable infrastructure: contract code and material on-chain records are intended to remain publicly verifiable.
- Utility before hype: product features and integrations are intended to create reasons to use VLT beyond trading.
- Sustainable liquidity: part of processed trading fees is directed toward liquidity growth.
- Controlled launch: early limits and configuration controls are intended to reduce launch risk and may later be removed or finalized.

5. Ecosystem Architecture

- User Layer - wallet, interfaces and future mobile or browser-extension clients
- Intelligence Layer - VoltAI guidance, support and future automation
- Economic Layer - VLT token, liquidity, treasury and payment utility

6. Product Components

6.1 VoltPay Wallet

VoltPay Wallet is a non-custodial Web3 interface intended to give users direct control of their assets while simplifying BNB Smart Chain interactions. Web and Telegram experiences are part of the current product direction; mobile applications and a browser extension are planned as the ecosystem expands.

- Self-custody of private keys
- BNB Smart Chain and VLT support
- Send and receive workflows
- QR and wallet-address interactions
- Transaction history and token display
- Fiat on-ramp access through approved third-party providers
- Planned gas sponsorship for eligible VLT transfers inside official clients

Gasless transfer clarification: A BNB Smart Chain transaction always consumes network gas. A sponsored or zero-fee VLT transfer means VoltPay infrastructure may pay that gas for an eligible transfer; it does not remove the underlying network fee.

6.2 VoltAI

VoltAI is the intelligent assistance layer of the ecosystem. Its intended role is to reduce user friction through contextual help, multilingual guidance and product support across official VoltPay interfaces.

- Real-time product guidance
- Simplified onboarding
- Multi-language assistance
- Website and Telegram integration direction
- Future wallet-level assistance and automation

6.3 VLT Utility

VLT is intended to be the native utility asset of the VoltPay ecosystem. Utility is expected to expand alongside product adoption and approved integrations.

- Wallet-native payments and transfers
- Merchant and marketplace payment integrations
- Ecosystem incentives and rewards where applicable
- Gas-sponsored transfer programs where available
- Liquidity and fee-based ecosystem mechanics
- Future services announced through official VoltPay channels

Product status. Deployed contract infrastructure is distinguished from wallet, AI, on-ramp, mobile, extension and merchant capabilities that remain in development, planned or dependent on third-party approval.

7. Tokenomics - Version 3.0

Total supply is permanently fixed at 200,000,000 VLT. Version 3.0 updates allocation presentation, presale parameters and transparency language only; it does not change the deployed smart contract, total supply, fees or core mechanics.

Revision notice: This allocation table supersedes every earlier VoltPay Whitepaper allocation section and previous token-distribution tables.

Allocation	VLT	Supply
Strategic Reserve	100,000,000	50.0%
Founder Allocation	20,000,000	10.0%
Presale	30,000,000	15.0%
Liquidity Reserve	20,000,000	10.0%
Team	10,000,000	5.0%
Marketing & Community	8,000,000	4.0%
Exchange Listings & Market Expansion	7,000,000	3.5%
Development & Operations	5,000,000	2.5%
TOTAL	200,000,000	100.0%

7.1 Allocation Policy

Strategic, founder, team and other designated allocations may be subject to on-chain locking or vesting schedules. Individual lock and vesting records are not duplicated in this Whitepaper; they are maintained through VoltPay's dedicated transparency resources so verification links can remain current.

Official transparency page: <https://voltpay.org/transparency>

Circulating supply will be determined from executed on-chain balances after presale, liquidity creation, vesting releases and operational distributions. An allocation label alone does not make tokens non-circulating.

8. Public Presale Framework

VoltPay's current presale plan is designed around broad participation, controlled distribution and substantial launch liquidity. The launchpad's final published configuration is authoritative.

Parameter	Planned Setting
Soft Cap	USD 50,000 equivalent
Hard Cap	USD 200,000 equivalent
Maximum Presale Allocation	30,000,000 VLT
Presale Price	USD 0.0068 per VLT
Planned Listing Price	USD 0.0076 per VLT
Minimum Contribution	USD 25 equivalent
Maximum Contribution	USD 5,000 equivalent per wallet
Duration	14 days
Liquidity Allocation	75%
LP Lock	365 days
Buyer Vesting	60% at TGE/finalization; 20% after 15 days; 20% after 30 days
Unsold Tokens	Returned, segregated and reserved for transparent future ecosystem use; not automatically burned

Final configuration rule: Exact contribution amounts may be represented in the launchpad's supported base asset. Final launchpad configuration, timing and contribution mechanics will be published before contributions open.

9. Locks, Vesting & Circulation Controls

VoltPay uses on-chain locks and vesting where applicable to support transparent supply management. Public documentation uses allocation-level disclosure, while individual verification records are consolidated on the project's transparency page. This avoids publishing personal names and prevents the Whitepaper from becoming outdated as records are added or updated.

- Liquidity-provider tokens generated at launch are planned to be locked for 365 days.
- Unsold presale tokens are not intended for unrestricted market release and are planned to remain segregated for transparent future ecosystem use.
- Material on-chain lock and vesting references are maintained at <https://voltpay.org/transparency>.

10. Fee & Liquidity Model

VLT applies transaction fees to recognized automated-market-maker activity:

Transaction	Fee
Buy	2%
Sell	4%

Collected VLT fees accumulate in the token contract and are processed through `processFees()`. Processed fees are split 50% to liquidity and 50% to treasury. Liquidity support may improve market depth but does not guarantee volume, price appreciation, a price floor or protection from market losses.

11. Launch & Market Stability Framework

- Trading starts disabled and must be explicitly enabled.
- Early transaction and wallet limits may be used during launch.
- Limits may later be removed as liquidity and distribution mature.
- Configuration and fee controls can be finalized or locked through contract functions.
- No new VLT can be minted beyond the fixed 200,000,000 supply.

12. Ecosystem Revenue Model

Potential operating inflows may include trading-fee treasury flows, approved on-ramp or integration economics, merchant or payment services and future product services where commercially and legally appropriate. These sources depend on real usage and third-party approval and are not guaranteed revenue, yield or investment return.

13. Utility & Adoption Strategy

- Increase wallet usage and make VLT a first-class asset inside official VoltPay interfaces.
- Integrate licensed fiat on-ramp providers where approved, reducing dependence on one provider.
- Offer controlled gas-sponsored VLT transfers to create a tangible wallet benefit.
- Integrate VLT with merchants, marketplaces and digital services where permitted.
- Expand toward mobile and browser-extension clients while preserving non-custodial key management.
- Publish verifiable contract, lock, liquidity, treasury and security information.

14. Security & Technical Validation

The deployed Mainnet source was frozen before deployment and matches the tested and validated source by SHA-256. VoltPay completed automated analysis, local functional testing, BSC Mainnet fork testing and live BSC Testnet validation before Mainnet deployment.

Validation	Result
Source SHA-256	9d708e7e874bdf72533d1f59d976049dfeeff9f3555aeccfd4c2bfdc94cbcdade
Local Hardhat tests	93 / 93 passing
BSC Mainnet fork test	1 / 1 passing against PancakeSwap V2 infrastructure
Total functional result	94 / 94 passing
Mythril	No issues reported in project run
SolidityScan	93.18/100; 0 Critical, 0 High, 0 Medium; 4 Low
BscScan source verification	Verified - Exact Match
Compiler	Solidity 0.8.35; optimizer 200 runs; EVM Paris

Scope statement: Automated scanners, internal tests, fork tests and testnet validation improve confidence but are not a substitute for an independent third-party audit, legal review or continuous production monitoring.

Security Operating Priorities

- Preserve the frozen deployed source and published hash.
- Complete an independent third-party smart contract audit as part of the pre-launch security process.
- Publish the final third-party audit report through official project resources once completed.
- Monitor liquidity, holder concentration and operational risks after launch.
- Publish material configuration, lock, vesting and treasury changes through official channels.

15. Mainnet Contract & Transparency

Item	Reference
Network	BNB Smart Chain - Chain ID 56
VLT Contract	0xE90714e6e4becEc65F33D3099F95B42B6e3168aE
PancakeSwap V2 Router	0x10ED43C718714eb63d5aA57B78B54704E256024E
VLT/WBNB Pair	0x6cFF8650a2e8Affd64a48eaf227A0C74cE767892
BscScan	Verified - Exact Match
Trading	Disabled during launch preparation
Transparency	https://voltpay.org/transparency

Detailed lock, vesting, liquidity, presale and other material on-chain references are maintained through VoltPay's transparency resources rather than duplicated throughout this Whitepaper.

16. Roadmap

Stage	Objectives
Mainnet Foundation	Completed: final source freeze and SHA-256 verification; 94/94 functional result; Mainnet deployment; BscScan Exact Match verification.
Pre-Launch Security & Verification	Complete independent third-party audit; complete launchpad KYC and business verification; finalize public transparency and presale documentation.
Public Presale	Open the planned 14-day public presale under the published launchpad configuration, including contribution limits and buyer vesting.
Market Launch	Create and lock liquidity; enable trading; validate live buy/sell behavior; publish launch and liquidity references; expand market metadata and trackers.
Product Expansion	Continue Web and Telegram wallet development; advance approved on-ramp integrations; progress mobile and browser-extension clients; introduce controlled gas sponsorship where feasible.
Merchant & Ecosystem Adoption	Develop merchant and marketplace integrations, strategic ecosystem relationships and broader public reporting.

Roadmap status: Future dates, integrations, funding, listings and product releases depend on development, security, compliance, market conditions and third-party approvals and are not guaranteed.

17. Treasury & Operational Governance

VoltPay intends to separate project treasury activity from user custody. Treasury funds are project assets and do not represent custodial balances of wallet users. As the ecosystem grows, VoltPay may introduce multisignature controls, documented treasury policies and periodic transparency reporting.

18. Risk Disclosure

- VLT is a cryptoasset and may experience substantial volatility or loss of value.
- Liquidity depth can change rapidly and quoted prices may not represent executable prices for large transactions.
- Smart contracts, wallets, RPC providers and third-party integrations may contain technical or operational risks.
- Fiat on-ramp availability depends on compliance approval, geography and provider policies.
- Presale completion, merchant adoption, grants, exchange listings, market-tracker inclusion and future product releases are not guaranteed.
- Nothing in this Whitepaper is a guarantee of profit, price appreciation, investment return or legal, tax or investment advice.

19. Conclusion

VoltPay is building a non-custodial Web3 payment ecosystem in which VLT is intended to have practical utility across wallet transfers, payments, liquidity and future integrations. The Mainnet contract is deployed and verified. The current pre-launch stage focuses on external security review, launchpad verification, public presale preparation, liquidity and transparent on-chain reporting before broader market expansion.
