Executive Summary

VoltPay is a non-custodial Web3 payment ecosystem built on BNB Smart Chain. The project combines the VoltPay Wallet, the VoltAI assistant and the VLT utility token into a single infrastructure focused on accessible digital payments, user-controlled custody and practical token utility.

The VLT smart contract is deployed on BNB Smart Chain mainnet and its source code is verified on BscScan as an Exact Match. Total supply is fixed at 200,000,000 VLT. Trading remains disabled until launch preparation, token distribution, liquidity provisioning and public transparency steps are completed.

Mainnet status

Contract deployed and verified. Liquidity, locks, vesting, presale and public trading are launch-stage actions and should be treated as planned until their corresponding on-chain transactions are published.

Parameter	Current status
Network	BNB Smart Chain (BSC Mainnet)
Token	VoltPay (VLT)
Standard	BEP-20 / ERC-20 compatible
Total Supply	200,000,000 VLT (fixed)
Decimals	18
Buy Fee	2%
Sell Fee	4%
Fee Split	50% liquidity / 50% treasury
Mainnet Contract	0xE90714e6e4becEc65F33D3099F95B42B6e3168aE
PancakeSwap V2 Pair	0x6cFF8650a2e8Affd64a48eaf227A0C74cE767892
Trading Status	Disabled during launch preparation

1. Introduction

VoltPay is designed to simplify the use of blockchain-based payments without taking custody of user assets. The ecosystem is structured around self-custody, accessible interfaces and practical VLT utility.

Rather than positioning VLT as a standalone speculative asset, VoltPay is intended to connect token activity with wallet usage, payments, liquidity and ecosystem services.

2. The Problem

Web3 adoption is still constrained by fragmented tools, wallet complexity, inconsistent onboarding and a user experience that often assumes technical knowledge.

- Complex wallet and network workflows
- Fragmented fiat-to-crypto access
- Limited guidance for non-technical users
- Weak connection between many tokens and real product utility
- Dependence on centralized custody in many payment experiences

3. The VoltPay Solution

VoltPay combines several components into one non-custodial ecosystem.

- VoltPay Wallet - user-controlled digital asset wallet
- VoltAI - multi-platform intelligent assistance and onboarding
- VLT - utility token for ecosystem activity and payments
- Fiat on-ramp integrations - planned through licensed third-party providers
- Merchant and marketplace integrations - planned for real-world utility
- Gas-sponsored VLT transfers - planned for eligible transfers inside official VoltPay clients

4. Design Principles

- Non-custodial by design: VoltPay does not require custody of user private keys for wallet operation.
- Verifiable infrastructure: contract code, token distribution, locks and liquidity proofs are intended to be publicly verifiable on-chain.
- Utility before hype: product features and integrations are designed to create reasons to use VLT beyond trading.
- Sustainable liquidity: part of trading fees is directed toward liquidity growth.
- Controlled launch: early-stage limits and configuration controls are intended to reduce launch risk and may be removed or finalized as the market matures.

5. Ecosystem Architecture

VoltPay is organized into three primary layers:

- User Layer - wallet, interfaces and future mobile/extension clients
- Intelligence Layer - VoltAI support and automation
- Economic Layer - VLT token, liquidity, treasury and payment utility

6. Product Components

6.1 VoltPay Wallet

VoltPay Wallet is a non-custodial Web3 interface intended to give users direct control of their assets while simplifying BNB Smart Chain interactions. Web and Telegram wallet experiences are part of the current product direction, with mobile and browser-extension clients planned as the ecosystem expands.

- Self-custody of private keys
- BNB Smart Chain and VLT support
- Send / receive workflows
- QR and wallet-address interactions
- Transaction history and token display
- Fiat on-ramp access through approved third-party providers
- Planned gas sponsorship for eligible VLT transfers inside official VoltPay clients

Gasless transfer clarification

A BNB Smart Chain transaction always consumes network gas. "Zero-fee VLT transfer" means VoltPay infrastructure may sponsor that gas for eligible transfers; it does not remove the underlying network fee.

6.2 VoltAI

VoltAI is the intelligent assistance layer of the ecosystem. Its role is to reduce user friction by providing contextual help, multilingual guidance and product support across VoltPay interfaces.

- Real-time product guidance
- Simplified onboarding
- Multi-language assistance
- Website and Telegram integration
- Future wallet-level assistance and automation

6.3 VLT Utility

VLT is intended to be the native utility asset of the VoltPay ecosystem. Its utility is expected to expand with product adoption and partner integrations.

- Wallet-native payments and transfers
- Merchant and marketplace payment integrations
- Ecosystem incentives and rewards where applicable
- Gas-sponsored transfer programs where available
- Liquidity and fee-based ecosystem mechanics
- Future services announced through official VoltPay channels

7. Tokenomics

Total supply is permanently fixed at 200,000,000 VLT. The following allocation framework is designed to separate long-term reserves, founder and team holdings, launch liquidity, presale capacity and ecosystem operating reserves.

Allocation	VLT	Supply	Policy
Strategic Reserve - Long Lock	100,000,000	50.0%	Planned long-term lock; public proof to be published
Founder Allocation	20,000,000	10.0%	Disclosed founder allocation; not part of the 100M strategic lock
Team - Vesting	10,000,000	5.0%	Planned vesting; 0% unlocked at launch
Presale	15,000,000	7.5%	Maximum allocation; unsold tokens not intended for unrestricted circulation
Liquidity Reserve	25,000,000	12.5%	Initial and future liquidity provisioning
Ecosystem & Partnerships	15,000,000	7.5%	Merchant, wallet and ecosystem integrations
Marketing & Community	10,000,000	5.0%	Growth, community and campaigns
Development & Operations	5,000,000	2.5%	Infrastructure, product and operating needs
TOTAL	200,000,000	100.0%	Fixed supply

Presale allocation policy. Presale terms, price, hard cap and timing will be published before the sale. Any unsold presale allocation is intended to be redirected to liquidity/ecosystem reserves or locked rather than released into unrestricted circulation without disclosure.

Founder transparency. Founder holdings are disclosed as a distinct category. Their on-chain address and material allocation movements can be disclosed through official transparency pages after distribution is finalized.

8. Locks, Vesting & Circulation Controls

- 100,000,000 VLT (50% of total supply) is designated for a long-term strategic lock. The project intends to publish the locker address, lock amount and unlock date after the lock transaction is completed.
- 10,000,000 VLT (5% of total supply) is designated for team vesting. The current policy target is 0% unlocked at launch, a 3-month cliff and subsequent linear vesting over 12 months.
- Founder allocation is disclosed separately and is not represented as locked unless an on-chain lock is actually executed.
- Liquidity tokens are intended to be locked after liquidity is created; proof will be published after the LP lock transaction.

9. Fee & Liquidity Model

VLT implements transaction fees on recognized automated-market-maker activity:

- Buy fee: 2%
- Sell fee: 4%
- Fee destination split: 50% liquidity / 50% treasury

The liquidity portion can be processed through the contract mechanism to add liquidity. The treasury portion supports ecosystem operations, product development, integrations and other disclosed project expenses. Fee settings are constrained by the deployed contract and can be reduced and locked according to contract rules.

10. Launch & Market Stability Framework

The contract contains launch-stage controls intended to reduce early market disruption. These controls are not a price guarantee and do not eliminate market risk.

- Trading starts disabled and must be explicitly enabled
- Early transaction and wallet limits can be used during launch
- Limits may later be removed as liquidity and distribution mature
- Configuration and fee controls can be finalized/locked through contract functions
- No new VLT can be minted beyond the fixed 200,000,000 supply

11. Ecosystem Revenue Model

VoltPay is designed so that ecosystem activity can contribute to operating sustainability without requiring continual sales of project-held tokens. Potential revenue and funding sources include trading-fee treasury flows, approved on-ramp or integration economics, merchant/payment services and future product services where legally and commercially appropriate.

Important

Trading-fee flow is variable and depends on actual market activity. It should not be interpreted as guaranteed revenue, yield or investment return.

12. Utility & Adoption Strategy

- Increase wallet usage and make VLT a first-class asset inside VoltPay interfaces.
- Integrate multiple licensed fiat on-ramp providers where approved, reducing dependence on a single provider.
- Offer gas-sponsored VLT transfers under controlled usage limits to create a tangible wallet benefit.
- Integrate VLT with merchants, marketplaces and digital services where commercially and legally permitted.
- Expand to mobile and browser-extension clients while preserving non-custodial key management.
- Publish verifiable contract, lock, liquidity and security information to reduce information asymmetry for users.

13. Security & Technical Validation

The deployed mainnet source was frozen before deployment and matched the audited/tested source by SHA-256. The project completed multiple layers of automated and functional validation before mainnet deployment.

Validation	Result
Source SHA-256	9d708e7e874bdf72533d1f59d976049dfeeff9f3555aeccfd4c2b fdc94cbcdade
Local Hardhat tests	93 / 93 passing
BSC mainnet fork test	1 / 1 passing against PancakeSwap V2 infrastructure
Total functional tests	94 / 94 passing
Mythril 0.24.8	No issues reported in project run
SolidityScan	93.18/100; 0 Critical, 0 High, 0 Medium; 4 Low (missing- events category)
BscScan source verification	Verified - Exact Match
Compiler	Solidity 0.8.35; optimizer 200 runs; EVM Paris

Scope statement

Automated scanners and internal/fork testing improve confidence but are not a substitute for an independent formal security audit, legal review or continuous production monitoring.

14. Mainnet Contract & Transparency

Network: BNB Smart Chain (chain ID 56)

Contract: 0xE90714e6e4becEc65F33D3099F95B42B6e3168aE

PancakeSwap V2 Router: 0x10ED43C718714eb63d5aA57B78B54704E256024E

Pair: 0x6cFF8650a2e8Affd64a48eaf227A0C74cE767892

BscScan: [Verified Contract](#)

At the time of this edition, the contract has been deployed and verified while public trading remains disabled pending completion of launch preparation. Lock, vesting, presale and liquidity proof links will be added to the project transparency materials once those transactions are completed.

15. Roadmap

Stage	Objectives
Completed / Mainnet foundation	Final contract freeze and hash verification; 94/94 functional tests; mainnet deployment; BscScan Exact Match source verification.
Launch preparation	Finalize whitepaper and tokenomics; update GitHub; publish token information; execute strategic lock and team

	vesting; prepare presale and liquidity.
Market launch	Create and lock liquidity; enable trading; verify real buy/sell behavior; publish proof links; expand token metadata and market trackers.
Product expansion	Continue web/Telegram wallet development; complete approved on-ramp integrations; deliver mobile and browser-extension clients; introduce controlled gas sponsorship for VLT transfers.
Merchant adoption	Develop merchant/payment integrations and marketplace partnerships; expand ecosystem usage and reporting.

16. Treasury & Operational Governance

VoltPay intends to separate operational treasury activity from user custody. Treasury funds are project assets and do not represent custodial balances of wallet users. As the ecosystem grows, the project may introduce additional governance safeguards such as multisignature treasury controls, documented treasury policies and periodic transparency reporting.

17. Risk Disclosure

- VLT is a cryptoasset and may experience substantial price volatility or loss of value.
- Liquidity depth can change rapidly and quoted token prices may not represent the price obtainable for large transactions.
- Smart contracts, wallets, bridges, RPC providers and third-party integrations may contain technical or operational risks.
- Fiat on-ramp availability depends on third-party compliance approval, geography and provider policies.
- Merchant adoption, exchange listings, market-tracker inclusion and future product releases are not guaranteed.
- Nothing in this whitepaper constitutes a guarantee of profit, price appreciation, investment return or legal/tax advice.

18. Conclusion

VoltPay is building a non-custodial Web3 payment ecosystem in which VLT is intended to have practical utility across wallet transfers, payments, liquidity and future integrations. The mainnet contract is deployed and verified; the next stage is to complete transparent token distribution, locks, liquidity and product integrations before broader market expansion.
